20k5ers Trading Bot

A fully automated trading program, built on the MM Blueprint trading method

NOT VALID - DO NOT USE OR SHARE. The backtests behind this report let the strategy see candles that had not finished yet (a daily candle at midnight already contained the whole next day's range). With completed candles only, the same strategy earned about $0 per year in five tested years (-$4k to +$10k, against $500k-$750k shown here). All figures below are inflated by this look-ahead. A corrected study follows.

In one minute

What it is

A computer program that buys and sells 26 currency pairs, the UK stock index and oil, without a human pressing buttons.

How it earns

It trades with a trading firm's money (a "prop firm"). After passing an entry test, the trader keeps 80–100% of the profit.

The catch

Strict rules: lose 5% in one day or 10% in total and the account is closed. The bot is built to never break them.

Robustness score

94/100

Robustness score

132 of 140 tests on random start dates reached their goal

Challenges passed 100 test runs of the entry exam, each starting on a random date		**94 of 100**
Funded accounts that survived 40 accounts started on random dates, run for 3, 5 or 8 years		**38 of 40**
Profitable years in one account traded non-stop from 2015 to 2025		**11 of 11**
Profitable months in that same 11-year account		**128 of 132**

The score counts only the random-start tests (the top two bars): each challenge had to be passed, each funded account had to stay open. Random start dates show how the bot does when you cannot pick a lucky moment to begin.

Key numbers

$50,000
starting account size, as given by the prop firm

21 days
typical time to pass the entry test (median)

$26k–$27k
average paid out per month to the trader, over 40 random start dates

4.6%
worst single day in 11 years. The limit is 5%

All figures come from replaying 11 years of real market prices (2015–2025), trade by trade, including the costs a real broker charges. The bot has not traded live yet.

How it was tested

TEST	WHAT IT CHECKS	RESULT
Entry test, 100 random start dates	Can it pass the prop firm's 2-step exam (+8%, then +5%)?	**94 passed**
Funded accounts, 40 random start dates	Does the account stay open for 3, 5 or 8 years?	**38 stayed open**
One account, 11 years non-stop	Did it ever break the 5% daily or 10% total loss rule?	**Never**
Remove one market at a time	Does every traded market add value? Seven that did not were dropped.	**29 kept**
Periods held back from tuning	Does it hold up on 70 periods it was not adjusted on?	**68 of 70 OK**
Swiss franc crash, 15 Jan 2015	Does it survive a sudden 30% currency move?	**Yes**

In total 1,236 separate test runs, after 915 settings were compared.

20k5ers Trading Bot · details

11 years, year by year

One $50,000 account started in January 2015 and traded until December 2025. The firm raises the account size as profit is made, up to $500,000.

YEAR	ACCOUNT SIZE	PAID OUT TO THE TRADER	MONTHS IN PROFIT	WORST DAY
2015	$50k → $400k	**$177,648**	11 of 12	3.8%
2016	$400k → $500k	**$391,144**	12 of 12	2.6%
2017	$500k → $500k	**$356,171**	12 of 12	2.1%
2018	$500k → $500k	**$357,809**	12 of 12	1.5%
2019	$500k → $500k	**$354,890**	12 of 12	1.5%
2020	$500k → $500k	**$402,507**	11 of 12	2.7%
2021	$500k → $500k	**$303,788**	12 of 12	2.1%
2022	$500k → $500k	**$406,924**	12 of 12	3.2%
2023	$500k → $500k	**$405,789**	12 of 12	1.1%
2024	$500k → $500k	**$352,369**	10 of 12	2.5%
2025	$500k → $500k	**$509,697**	12 of 12	2.8%
Total	**$50k → $500k**	**$4,018,736**	**128 of 132**	**3.8%**

Worst day = the biggest loss on trades closed that day. Counting trades that were still open, the worst moment in 11 years was 4.6%, still under the 5% limit. On average $30,445 per month. This start date was a good one; over 40 random start dates the average was $26k–$27k per month.

Compared with other approaches

APPROACH	RETURN PER UNIT OF RISK Sharpe ratio, higher is better	BIGGEST FALL FROM A PEAK lower is better	PASSES A PROP-FIRM TEST
This bot (historical test)	**6.0**	**5.3%**	**94 of 100**
Buying the S&P 500 and holding it	≈ 0.7	≈ 34%	–
Professional systematic hedge funds (average)	≈ 0.5–0.8	≈ 10–20%	–
Retail traders attempting a prop-firm test	–	–	≈ 5–10 of 100

Comparison rows are approximate public figures, not measured on this data. Historical tests usually look better than live trading, so treat the bot's numbers as a best case until it has a live record.

Words used in this report

Prop firm – a company that lends its capital to traders who pass its test and shares the profit.

Challenge / entry test – reach +8%, then +5%, without breaking the loss rules.

Funded account – the real account you get after passing; profit is paid out to you.

Drawdown – how far the account falls from its highest point.

Daily loss limit – the most the account may lose in one day (5%).

Sharpe ratio – profit divided by how much results swing; above 1 is considered good.

Historical test (backtest) – running the bot on past prices as if it were live.

Random start date – starting a test on an arbitrary day, so no lucky timing.

Important. These are results on past data, not a promise of future returns. The bot was tuned on the same years it was tested on, and has no live track record yet. Prop-firm rules also cap what it can do: trading own capital without those limits would allow a different, larger approach.
